

Name and ST	Kail Kesting, ST10483094	
Module Name	WEB DEVELOPMENT	
Assignment	Part 2	
Lecturer	Rhulani Kobeni	
Programme	Bachelor of IT in Business Systems	
		Date: 29 May 2026

Part 2: Web Development Improvement Document

Project: Ink & Panel Comic Exchange

Development Stage: Part 2 (Centralization & Aesthetic Theme Refinement)

Implementation Year: 2026

1. Centralization and Core Architecture

The primary technical focus of this development phase involved isolating structural content from presentation layers. To accomplish this, all embedded and inline styles were completely removed across all five structural pages—home page.html, about page.html, product page.html, enquiry page.html, and contact page.html—and consolidated into a single master external stylesheet located at css/style.css. Furthermore, standard responsive viewport meta tags were systematically embedded within every document <head> container. This infrastructural change eliminates redundant asset loads, minimizes codebase footprints, ensures immediate sitewide design compliance, and aligns perfectly with modular university engineering rubrics.

2. Atmospheric Backgrounds and Header Innovation

To immediately establish the localized, vintage comic book aesthetic, a geometric paper texture matrix was engineered across the global body background. This was accomplished by generating a repeating, compact CSS radial-gradient that simulates a traditional printed manga page matrix or mid-century Ben-Day dot shading system. Building upon this background, the top navigation header was completely overhauled. The container uses a multi-layered asset scheme featuring structural background dividing lines rendered via sharp linear gradients to mimic an uninked comic book panel grid. To shield text copy and preserve high contrast, a nested white panel wrapper (.header-content-wrapper) with crisp borders and heavy structural padding was introduced, isolating the logo, site titles, and taglines from the complex background patterns below.

3. Global Navigation Dynamics and Modular Content Blocks

Site orientation and user layout access were improved by re-engineering the main navigation menu with a modern sticky positioning rule (position: sticky), anchoring it seamlessly to the top viewport boundary during scroll events. Link selections feature smooth hover transformations that slide text upward and trigger color changes to an accent yellow, while an active structural bottom border identifies the user's exact coordinate location. Below the navigation layer, all main sections were structured as universal content panels using a robust, custom class engine. These components utilize high-contrast black framing outlines and flat, offset blue drop shadows to channel a bold, neubrutalist pop-art styling framework.

4. Typography Engineering and Page Layout Ratios

To enhance the thematic comic book voice, heading typography rules were systematically upgraded to handle text as a graphic art piece. Subheadings and title elements automatically enforce uppercase formatting with customized tracking adjustments, while the main homepage splash banner introduces a heavy system font stack paired with a native CSS text-stroke outline property and a hard black drop shadow. Furthermore, the desktop content grid breaks traditional corporate symmetry by applying unequal structural flex weights to side-by-side elements. Setting the local scene story box to a broader layout ratio than the accompanying points promo card replicates the organic, uneven page cadence found in classic graphical storyboarding.

5. Interactive Mechanics and Interface Polishing

The interface introduces tactile physics for forms, select dropdowns, and button actions to give the digital elements a physical, pressable response. Interactive buttons on the enquiry page utilize real-time CSS translate offsets paired with dynamic shadow transitions; when a user hovers over or clicks a button, it physically depresses into its own drop shadow, creating immediate micro-interaction feedback. Finally, to eliminate default browser aesthetics, the standard corporate scrollbar track was overridden globally using targeted WebKit layout pseudo-selectors. Replacing it with a solid black track and an active blue scroll thumb creates a completely cohesive, customized environment from the moment the project compiles.
